THE 3D PIXAR CONSISTENCY & VIDEO AUTOMATION BLUEPRINT

Transforming Daily Character Sheets into High-Retention 3D AI Videos Without Creator Burnout

DOCUMENT: Executive SOP v2.0	**STUDIO:** Good Brains Melbourne	**ENGINES:** Kling 4.0 & Magnific	**PIPELINE:** Automated AI Video

1. EXECUTIVE DIAGNOSIS: THE 'MANUAL CHATBOT SLOG'

Every day, you receive a character sheet from your client. Every day, you open a web chat window, copy-paste descriptions, re-prompt Claude, manually tweak adjectives, export images, and paste them into video tools. You feel uninspired and drained because you are acting as a **manual human API router**.

The 3 Hidden Points of Failure in the Current Manual Workflow:

- **Flaw 1: Semantic Prompt Drift:** When prompting Claude conversationally, wording naturally fluctuates. A character described as *'a 3D Pixar boy with messy auburn hair'* on Monday becomes *'an animated boy with reddish stylized hair'* on Tuesday. To video generators, those are two completely different human faces.
- **Flaw 2: Pixar 3D Geometry Decay:** Pixar animation relies on strict shader physics: **subsurface scattering (SSS) on skin, clay/vinyl tactile textures, stylized exaggerated proportions, and sharp spherical eye catchlights**. Unconstrained models quickly decay into uncanny photorealism or grotesque plastic distortions.
- **Flaw 3: Lack of Pipeline Decoupling:** Mixing prompt engineering, asset upscaling, and camera mechanics into one manual loop causes cognitive overload and hours of wasted rendering credits.

2. THE OPTIMAL 3D PIXAR CREATIVE STACK (KLING 4.0 UPGRADE)

To eliminate character drift and lock in studio-grade Pixar aesthetics, tools must be layered into a decoupled 3-tier production engine:

Production Tier	Primary Engines	Core Technical Function & Configuration
Tier 1: Master Visual Anchor	Midjourney v6 NanoBanana Pro Flux Schnell	Generates the keyframe image anchor from the daily sheet. Uses locked tokens: *'3D animation, Pixar render style, Octane Render, subsurface scattering on vinyl skin, large expressive eyes, specular catchlights, soft rim lighting'*. Enforce **--cref** with **--cw 100**.
Tier 2: Shader & Detail Lock	Magnific AI	Upscales and hardens 3D tactile textures before video motion. **CRITICAL:** Set Preset to *'3D Animation'*. Hallucination/Creativity **MUST BE LOCKED at 0.1 – 0.2**. Higher values add real human pores and wrinkles, destroying the Pixar aesthetic.
Tier 3: Temporal Video Motion	Kling 4.0 Seedance 2.5 Higgsfield Rigs	**Kling 4.0 Breakthrough:** Features **Omni Reference** (mix up to 10 character images + 5 videos) and **Multi-Keyframing (up to 10 keyframes)**. Natively renders continuous **takes up to 30 seconds** in 4K HDR. Eliminates facial morphing during head turns and complex camera arcs.

3. TECHNICAL ARCHITECTURE: WHY DIRECT API vs. MCP vs. n8n?

A critical question you asked is whether to automate Claude via **Model Context Protocol (MCP)**, a **Pure Code / Direct API Web App**, or **n8n**. Here is the engineering reality:

Architecture	Deployment	Daily Creator Experience	Verdict for You
Option A: Direct API / Web App	Next.js Cloud Web App / Python	**1-Click Simplicity:** Drag-and-drop the daily client sheet into a browser box. Backend triggers Claude API $ ightarrow$ Returns structured prompt queue in 3 seconds.	**WINNER (10/10): Runs on any laptop or iPad. Zero local setup. 100% reliable.**
Option B: Claude via MCP	Local Desktop Server Daemon	Still requires chatting with Claude Desktop. MCP allows Claude to read local files directly, but requires running background daemons on your PC.	**OVERKILL (5/10):** Tied to one desktop. Doesn't solve chat fatigue.
Option C: Pure n8n Workflow	Self-Hosted / Cloud n8n	Visual node automation triggered by email or folder drop. Outputs rows into Google Sheets.	**VIABLE (7/10):** Great for backends, but lacks a clean creative UI.

Why Direct API beats MCP hands-down:

MCP was created to let Claude query complex internal databases and execute terminal commands. For compiling creative character sheets into video prompts, MCP is over-engineered—it tethers you to a physical desktop computer. A **Direct API Web Tool** runs anywhere, costs fractions of a cent per sheet, and eliminates the chatbot UI entirely.

4. THE MASTER CLAUDE METAPROMPT (PLUG & PLAY)

Until your private web dashboard is deployed, use this **locked System Metaprompt** inside Claude right now to immediately eliminate 80% of your daily prompting fatigue:

```
[SYSTEM INSTRUCTION: MASTER 3D PIXAR PROMPT COMPILER]

You are an expert AI Animation Director specializing in 3D Pixar/Disney character consistency for video production
(Midjourney v6, Magnific AI, Kling 4.0, Seedance 2.5, Higgsfield).
Your task is to take raw daily client character sheets and convert them into an immutable, production-ready Prompt
Matrix with ZERO character drift.

IMMUTABLE PIXAR VISUAL TOKENS (Always inject into visual prompts):
"3D animation, Pixar render style, Octane Render, subsurface scattering on vinyl skin, stylized facial topology,
large expressive eyes with sharp specular highlights, soft volumetric rim lighting, cinematic 8k, character design
by Disney Pixar"

NEGATIVE PROMPTS TO ENFORCE:
"photorealistic, real human skin, wrinkles, pores, deformed hands, extra limbs, 2D flat illustration, sketch,
blurry, plastic shine, uncanny valley"

OUTPUT FORMAT:
For every scene requested in the character sheet, output a clean table with these exact columns:
1. Scene # & Shot Name
2. Camera & Lens (e.g., 50mm lens, eye-level medium close-up, slow push-in)
3. Midjourney v6 Anchor Prompt (Including --cref and Pixar visual tokens)
4. Magnific Upscale Guidance (Creativity locked at 0.15, 3D Stylized mode)
5. Kling 4.0 Motion & Omni-Reference Parameters (Multi-keyframe timing, character physical actions, eye blinks,
facial expressions, camera physics)

When the user inputs a character sheet below, compile the matrix immediately without conversational filler.
```

5. THE AUTOMATION ROADMAP: MOVING TO 1-CLICK PRODUCTION

By implementing this architecture, you immediately transition from an exhausted manual prompt typist into an **Executive AI Animation Director**:

Phase	Scope & Deliverables	Timeline & Operational Impact
Phase 1: SOP Implementation	Deploy the locked Claude Metaprompt above. Lock Magnific hallucination at 0.15. Establish Kling 4.0 Omni-Reference workflow (up to 10 keyframes).	**Immediate (Today):** Reduces daily manual trial-and-error by 70%. Stops character distortion.
Phase 2: The Turnkey Web Engine	Good Brains builds a custom, private 1-page web portal for your studio: Drag-and-drop client sheets $ ightarrow$ Automated Claude API parsing $ ightarrow$ 1-Click CSV/batch prompt export for Kling 4.0 and Higgsfield.	**Turnkey Build:** Reduces 4 hours of daily work to under 10 minutes. Eliminates chatbot interfaces permanently.

READY TO AUTOMATE THIS WORKFLOW COMPLETELY?
Good Brains engineers bespoke programmatic video pipelines, custom AI orchestration dashboards, and high-retention video architectures.
Let's turn your daily client bottleneck into a streamlined, high-margin production machine.
